WATER & WASTEWATER DIVISION

Overview

- Water Main - Materials
- Specifications
- Installation
- Future?

ST. JOHN'S

DEPARTMENT OF PUBLIC WORKS
WATER & WASTEWATER DIVISION

Water Main Materials

Material Types

There are various material types used for water mains, these include:

- Ductile Iron Pipe
- Polyvinyl Chloride (PVC)
- Concrete Steel Cylinder
- Polyethylene

ST. JOHN'S

DEPARTMENT OF PUBLIC WORKS
WATER & WASTEWATER DIVISION

Water Main Specifications

Specifications

Provide information on approved materials, installation methods and typical drawings.

- Department of Municipal and Intergovernmental Affairs – Municipal Water, Sewer and Roads Master Construction Specification Book, Section 02713
- City of St. John's – Specification Book, Section 230

ST. JOHN'S

DEPARTMENT OF PUBLIC WORKS
WATER & WASTEWATER DIVISION

Water Main Specifications

Specifications - Examples

- Approved Pipe Materials
 - Ductile Iron, PVC, Conc. Steel Cylinder
- Pressure Classes of Pipe
 - DI Pipe Class = 350, 250, 200
 - PVC Pipe = DR 14, 18, 21
- Valves
 - Opening Direction, Operating Nut
- Service Pipe
 - Approved Materials and Diameter

ST. JOHN'S

DEPARTMENT OF PUBLIC WORKS
WATER & WASTEWATER DIVISION

Water Main Installation

Pipe Trench

- Excavated to depth specified on drawings, minimum 2 m cover.
- Pipe Bedding
 - Class “B” Material
 - 150 mm Below
 - 300 mm Above
- Marker Tape

ST. JOHN'S

DEPARTMENT OF PUBLIC WORKS
WATER & WASTEWATER DIVISION

Water Main Installation

ST. JOHN'S

DEPARTMENT OF PUBLIC WORKS
WATER & WASTEWATER DIVISION

Water Main Installation

Pipe Protection

- Debris caps are required on all pipes supplied to CSJ.
- Caps keep debris out of pipes during transportation and installation resulting in lower chance of contamination.
- Required on both bell and spigot ends of pipe

ST. JOHN'S

DEPARTMENT OF PUBLIC WORKS
WATER & WASTEWATER DIVISION

Water Main Installation

Pipe Assembly

- Pipe laid in trench at design grade and assembled using come-along or pry bar
- However typically pushed together with excavator, there is a risk pushing the pipe into the bell to far and damaging the bell
- On PVC pipe there is a line indicating required insertion depth of pipe.

ST. JOHN'S

DEPARTMENT OF PUBLIC WORKS
WATER & WASTEWATER DIVISION

Water Main Installation

Thrust Blocks

- Required at specified locations such as bends, tees, valves, reducers, end caps.
- Required to be constructed as per Standards Drawings in Specification

ST. JOHN'S

DEPARTMENT OF PUBLIC WORKS
WATER & WASTEWATER DIVISION

Water Main Installation

ABBREVIATIONS

- R - REACTION IN 1000kg
- B - MINIMUM BEARING AREA AT SOIL TO CONCRETE FACE IN m²
- CONC - VOLUME OF CONCRETE IN m³
- A & B - DIMENSION OF CONCRETE IN mm UNLESS OTHERWISE NOTED

NOTES

1. CONCRETE - 20MPa 28 DAY STRENGTH
2. BLOCKS SHALL BE POURED DIRECTLY AGAINST UNDISTURBED SOIL AS INDICATED
3. DESIGN DATA - STATIC PRESSURE 1000 KPa MINIMUM BEARING CAPACITY OF SOIL 130 KPa

ST. JOHN'S

DEPARTMENT OF PUBLIC WORKS
WATER & WASTEWATER DIVISION

Water Main Installation

Thrust Blocks

- An alternate to thrust blocks is the use of mechanical joint restraints.
- Prior to installation location of joint restraints must be determined by design Engineer. Typically the fitting is restrained plus several lengths of pipe on either side of fitting.
- Two types of restraints:
 - Restraining Gland Ring – Megalug or Megaholder
 - Restraining Joint Restraint

Water Main Installation

Air and Vacuum Release

- The design of a water distribution system must recognize the importance of alleviating air from the system and breaking a vacuum should it form.
- These conditions typically form when a water main is being filled or drained for planned maintenance or during emergencies.
- Air Release can be accomplished by either:
 - Installing a fire hydrant at the high point;
 - Placing a water service at the high point:
 - Installing an Air Release valve at the high point.

ST. JOHN'S

DEPARTMENT OF PUBLIC WORKS
WATER & WASTEWATER DIVISION

Water Main Installation

Corrosion Control

- Metallic components of a water distribution system can experience corrosion.
- Corrosion could be caused by:
 - Soil conditions;
 - Dissimilar materials;
 - Stray current.
- Corrosion control can be accomplished by either:
 - Using non-metallic components;
 - Installing zinc anodes;
 - Wrapping metallic pipe in polyethylene.

Service Connections – Ductile Iron

- Direct tapping is permitted up to 25 mm diameter.
- Service greater than 25 mm diameter require service saddle.
- Service connections should be a minimum of 1 m from adjacent service, pipe bell or fitting.
- Direct tap completed using drill and tap bit.
- Tap connection through service saddle completed using shell cutter bit.

Water Main Installation

Service Connections – PVC

- Direct tapping can be done but not recommended.
- New Construction – use tap tee.
- Tapping to be completed with service saddle.
- Service connections should be a minimum of 1 m from adjacent service, pipe bell or fitting.
- Tap connection through service saddle completed using shell cutter bit.

Testing

- Swabbing or Pigging
- Pressure Test
- Leakage Test
- Chlorination

ST. JOHN'S

DEPARTMENT OF PUBLIC WORKS
WATER & WASTEWATER DIVISION

Water Main Installation

Swabbing / Pigging

- To remove material and debris from lines.

ST. JOHN'S

DEPARTMENT OF PUBLIC WORKS
WATER & WASTEWATER DIVISION

Water Main Installation

Pressure Test

- New water main tested at 150% of normal operating pressure.
- Each section of pipe slowly filled with water and air expelled and tested

Leakage Test

- Conducted concurrently with pressure test.
- Measure quantity of water required to maintain pressure, must not exceed calculated value

ST. JOHN'S

DEPARTMENT OF PUBLIC WORKS
WATER & WASTEWATER DIVISION

Water Main Installation

Chlorination

- Chlorine solution added and left for 24 hours.
- Water flushed from line and sample taken.
- Two consecutive samples required to be collected.

ST. JOHN'S

DEPARTMENT OF PUBLIC WORKS
WATER & WASTEWATER DIVISION

Water Main Installation

Tracing / Locating

- Water main material determines type of tracing.
- Metallic material can be used as a conductor for locating buried infrastructure
- PVC material requires separate method for locating buried infrastructure.

Future Water Main Installation

New PVC Material

- Molecularly enhanced PVC – biaxially oriented
- Features:
 - Pipe is lighter therefore it is easier to handle and install.
 - Greater tensile strength
 - Greater impact strength
 - Crack resistance, prevents crack propagation
 - Thinner pipe wall = larger inside pipe diameter resulting in improved flows.

A nighttime aerial photograph of St. John's, Newfoundland, showing the city lights reflecting on the harbor water. The sky is a deep blue, and the city lights are a mix of warm yellow and white. The harbor is filled with boats and structures, and the city extends up a hillside in the background.

Thank You

ST. JOHN'S
